

chrome_tab_organiser

v1.41 Editor Quick Guide · document suffix `_261004`

Start it

```
python chrome_report_edit_v1.41.py
```

or double-click `chrome_report_edit_v1.41.exe`. It opens `http://127.0.0.1:8765/`. Pick a report from the dropdown and press **Load**, or use **Open...** to load a file from anywhere.

The fixed feature: drag to reorder

Group	Tab	URL
 + × 	Alpha	https://a.example/

 press and hold HERE, then drag

- 1. Press and hold the  **grip** and move the mouse.
- 2. Drag up or down inside the window, or into **another window's table**.
- 3. The row dims, follows the pointer, and the target table is outlined.
- 4. **Release anywhere over the table** — the move commits.

Release point	Result
Above a row's midpoint	Insert before it
Below a row's midpoint	Insert after it
Past the last row	Insert at the end
Another window's table	Insert into that window

It works releasing over the group chip, another row's grips, a tab link, or a bare cell — v1.41 commits on `dragend`, so the release point no longer needs to be a perfect drop target.

Starts from the grip only — clicking text still edits it and links still do not jump.

Sorting groups

The **sort groups alphabetically** checkbox puts ungrouped tabs first, then groups A→Z. **An actual drag switches it off automatically** so your manual order is kept; merely clicking the grip does not.

Other controls (unchanged)

Control	What it does
---------	--------------

Click Window N	Rename the window
Click a group chip	Rename the group
Click a tab title / URL	Edit it in place
+ on a row	Insert a tab after that row
× on a row	Delete that tab
Add tab in a window head	Insert into that window
Ctrl/⌘ + Backspace	Delete the focused row
Save / Enter in the name box	Write the report to disk

Saving

Type a new name to create a new file, or leave the existing name to overwrite the loaded one. Editor controls and drag state are stripped automatically — the saved file is a clean report.

Row numbering

`data-pos` is renumbered `1..N` after every insert, delete, drag, sort and save. Older reports without `data-pos` stay that way.
