

chrome_tab_organiser

v1.4 Editor Quick Guide · document suffix `_261004`

Start it

```
python chrome_report_edit_v1.4.py
```

or double-click `chrome_report_edit_v1.4.exe` . It opens `http://127.0.0.1:8765/` . Pick a report from the dropdown and press **Load**, or use **Open...** to load a file from anywhere.

The one new thing: drag to reorder

Group	Tab	URL
 + × 	Alpha	https://a.example/

 press and hold HERE, then drag

- 1. Press and hold the  **grip**.
- 2. Drag up or down inside the window, or into **another window's table**.
- 3. Release to drop.

Drop point	Result
Top half of a row	Insert before it
Bottom half of a row	Insert after it
Below the last row	Insert at the end
Another window's table	Insert into that window

The dragged row is dimmed; the target table gets a blue outline.

Starts from the grip only. Clicking the group name, tab title or URL still edits that text, and links still do not jump — dragging never gets in the way of hand-editing.

Sorting groups

The **sort groups alphabetically** checkbox puts ungrouped tabs first, then groups A→Z. **Starting a drag switches it off automatically** so your manual order is kept. Unchecking afterwards will not snap rows back.

Other controls (unchanged)

Control	What it does
Click Window N	Rename the window

Click a group chip	Rename the group
Click a tab title / URL	Edit it in place
+ on a row	Insert a tab after that row
× on a row	Delete that tab
Add tab in a window head	Insert into that window
Ctrl/⌘ + Backspace	Delete the focused row
Save / Enter in the name box	Write the report to disk

Saving

Type a new name to create a new file, or leave the existing name to overwrite the file you loaded. Names must be simple `.html` files inside the managed folder. Editor controls are stripped automatically — the saved file is a clean report, ready to open in any browser.

Row numbering

`data-pos` is renumbered `1..N` after every insert, delete, drag, sort and save. Older reports that have no `data-pos` at all stay that way.
